APPLICATION GRAPH (Reference only)

USING GRAPH AT LEFT

Graph at left is used to determine number of intermediate trolleys required for a given ACTIVE TRAVEL distance with a given LOOP DEPTH. To use graph, select appropriate active travel curve and a loop depth that will clear obstructions. Find point where vertical line (loop depth) intersects curve and follow across to find number of trolleys required. In addition, one fixed and one tow trolley are required. Consult factory or your local representative for more detailed application parameters.

INDICATING BEAM SIZE

Model numbers above must be completed by indicating beam size as last digits using table below.

S6 x 12.5 = **S06** • S8 x 18.4 = **S08** • S10 x 25.4 = **S10**

Example:

PDQ-450-10-0304I-**S06**

MINIMUM STORAGE DISTANCE

Minimum storage distance = sum of "L" dimension of all trolleys in system (see drawings above). This includes one fixed trolley, one tow trolley, and number of intermediate trolleys as determined on front. Minimum storage distance + active travel distance = total system length.
