# AclaraONE Events Application Programming Interface (API)

Your data. Your way.

As a robust enhancement to the AclaraONE® software solution, the events application programming interface (API) provides secure, convenient access to event data. API offers customers a fully customizable and tailored experience for event notifications, including consumption, data collection unit alarms, network health, and time synchronization. With direct access to the event type, severity, date, and other parameters, our customers can get the data they need, exactly the way they want it.

Events Summary Dashboard

How it works

The events API within AclaraONE allows access customized notifications for status changes, alarms, or alerts that require attention. Accessing these events through an API allows our customers to combine AclaraONE data with other data sources to create a comprehensive view of current and historical events.

With its secure data access, the events API makes it possible to leverage application data more effectively. Customers can use the secure data to source a data lake, provide information for external reports, or support organizational KPIs and other metrics.

Key Features

- Receive timely customized event notifications
- Ensure safe and secure data transfer
- Access AclaraONE events data from another analytics monitoring platform
- Monitor all five event types across electric, water, and gas utilities
