therm Oweld[®]

thermOweld® Connections are Now EMF Certified!

The scope of IEEE 837-2014 provides standard direction and methods for qualifying permanent connections used for substations grounding. It particularly addresses the connection used within the power distribution system, the connection used to join leads to the grid and the connections used to join leads to equipment and structures.

thermOweld® is continually conducting IEEE testing and striving to improve their product lines. Check with your thermOweld® sales force for product updates.
