## Make A Change. Make A Difference.

The reduction of Greenhouse Gas (GHG) emissions from the distribution channel is an issue that is front and center in our industry and in our world.

Unfortunately, if your company utilizes products that require methods like those incorporating rubber bags when servicing or changing out your residential meter sets, you're contributing to the growing problem of (GHG) emissions.

Making a change to the Lyall A-9 Bypass Valve will make a positive difference not only in your GHG emissions, but also to your bottom line. The Lyall A-9 Bypass Valve eliminates the need for any type of bag, thereby eliminating any release of gas during the bypass process. And because service to the customer is never interrupted, relighting call-backs are eliminated as well. The valve can be used as a stand-alone unit or integrated into a Lyall prefabricated meter set or multiple meter set for an even greener footprint, as less joints assembled in the field equates to less potential leak points.
