

Electric motors power critical parts of the economy, including conveyors. More than ever, consumers are purchasing products online and having them shipped directly to their home. Customers value online shopping because it reduces shopping time increasing productivity, inherently provides social distancing, and intelligence by allowing them to easily compare products. To meet shipping requirements for this growing market, demand for more conveyors are at a premium.

These key features—Productivity, Social Distancing and Information—are also provided by the products showcased in Hubbell’s conveyor solutions guide. The various options help ensure that no matter the application or customer preference, Hubbell has the conveyor solution for you.

Enhanced Productivity
 by significantly reducing motor replacement time by integrating LINKOSITY® plug-and-play technology

Maintain Social Distancing
 by visually confirming voltage presence from a distance without having to touch the disconnect

Increased Intelligence
 by reducing potential injury with a secondary visual verification of power isolation to the load

Enhance Productivity
 Visually confirms the presence of voltage, reducing movement required by personnel.

Increase Intelligence
 Provides a secondary visual verification of isolation of power to the load, increasing safety and reducing potential injury.

inSIGHT™

Enhance Productivity
 Significantly reduces motor replacement time by combining LINKOSITY® plug-and-play technology and Hubbell motor disconnects.

MotorQuick®

Enhance Productivity
 15° sloped top design minimizes places for bacteria, helping support the efforts of cleaning crews to ensure to a safe, clean facility.

Increase Intelligence
 Best practices in hygienic design call for stainless steel and minimal flat surfaces. Build intelligence into your design by meeting both standards.

inSIGHT™ Data Monitoring

Data collection and analytics are critical to ensuring efficiency, uptime, and quality. Hubbell's line of intelligent data monitoring devices provides data directly at the point of use, while helping to predict potential process changes. Wirelessly monitor and track performance indicators such as voltage, power, internal device temperature, and utility grade metering.

The ethernet gateway gathers data from all connected devices through a wireless mesh network and sends it to the user's front end dashboard for analysis.

Cloud-based or local software options are available. Programmable data thresholds can be preconfigured to alert users when outputs exceed the set parameters.
