

Applications where power is critical and conditions are abusive is a place where reliable watertight devices can make the difference.

Hubbell has one of the broadest offerings of water and dust tight connections. These devices were engineered to withstand harsh environments such as such as wet and caustic wash downs in food and beverage processing and abusive outdoor applications such as agriculture, construction, shipyards and outdoor entertainment.

Hubbell connections help enhance productivity, support social distancing and can even provide users information. No matter what your preferred connector style Hubbell's watertight solutions guide has the reliable solution for you.

Enhanced Productivity

Install devices that can withstand harsh washdown procedures, clean easily and stay clean

Maintain Social Distancing

Devices can communicate real time performance of a connection via text or email for remote monitoring of devices. LEDs provide visual confirmation of voltage presence from a distance without having to touch the connection.

Increased Intelligence

Dashboards display information gathered from devices to provide visual and historical analysis for predictive maintenance and on the spot decision making.

Enhance Productivity
Certified by NSF to easily get and stay clean to support cleaning crew efforts.

Increase Intelligence
Status indicating LEDs illuminate within the housing to indicate wiring condition for rapid visual status check.

Enhance Productivity
Approved as a disconnecting means for both motor and branch circuits at point of use.

Enhance Productivity
Switch-rated connections improve safety and can help simplify NFPA 70E compliance.

Maintain Social Distancing
Key data elements can be remotely reviewed.

Increase Intelligence
Tracking critical performance indicators over time allows proactive predictive maintenance.

inSIGHT™ Data Monitoring

Data collection and analytics are critical to ensuring efficiency, uptime, and quality. Hubbell's line of intelligent data monitoring devices provides data directly at the point of use, while helping to predict potential process changes. Wirelessly monitor and track performance indicators such as voltage, power, internal device temperature, and utility grade metering.

The ethernet gateway gathers data from all connected devices through a wireless mesh network and sends it to the user's front end dashboard for analysis.

Cloud-based or local software options are available. Programmable data thresholds can be preconfigured to alert users when outputs exceed the set parameters.
