

Skins

By AccelTex Solutions

Our vinyl covers or “skins” are an innovative way to hide Wi-Fi products by blending them into any environment. The skins go directly on the product and can also be easily removed if necessary. The skins can be made to match into any background including rock, foliage, brick and wood.

The skin is a self-sticking piece of vinyl that adheres to your Wi-Fi product. This vinyl can be stretched over curves and corners. Depending on the shape of your product and the pattern of the print, multiple cuts may have to be made to get the vinyl to lay flat.

Features

- The skins go directly on the product and can also be easily removed if necessary
- The skins can be made to match into any background including rock, foliage, brick and wood
- The skins do NOT effect RF coverage
- They are outdoor-rated and are durable enough to withstand outdoor environments
- Eliminates the need to go to an additional resource after product purchase to make the wi-fi product match the environment. Everything is taken care of in one step – streamlining the purchase process and reducing turn-around times on deployment completion

- ***The life expectancy of the vinyl skin cover is 3-5 years depending on the amount of direct sun exposure. The vinyl is laminated so it has an extra layer of protection. Laminating vinyl helps with durability – protecting against UV rays, scratches, and fading.***
