

# Design Tests

## Veri\*Lite™ 69kV Line Post Insulator

Performed in Accordance with all applicable ANSI/IEEE Standards

March 1992

This design test report records the results of laboratory tests made on the Ohio Brass Veri\*Lite 69 kV line post insulators.

Test Reference was the standard procedures of ANSI C29.1 and IEC Standards where applicable.

## I. 60 Hz Dry Flashover and Withstand

Tests were performed in accordance with ANSI C29.1, sections 4.2 and 4.4. Three insulators designed for horizontal mounting and three for vertical mounting were tested. The results, corrected to standard atmospheric conditions according to ANSI C29, are summarized as follows:

### Catalog No. 402069-0100 (Horizontal)

	<b>Insulator Sample</b>		
	<b>1</b>	<b>2</b>	<b>3</b>
Flashover, kV	242	244	230
Withstand, kV	226	226	215

### Catalog No. 402069-0209 (Vertical)

	<b>Insulator Sample</b>		
	<b>4</b>	<b>5</b>	<b>6</b>
Flashover, kV	216	220	224
Withstand, kV	201	206	206

## II. 60 Hz Wet Flashover and Withstand

Tests were performed in accordance with ANSI C29.1, sections 4.3 and 4.5. Three insulators designed for horizontal mounting and three for vertical mounting were tested. The results, corrected to standard atmospheric conditions according to ANSI C29.1, are summarized as follows:

### Catalog No. 402069-0100 (Horizontal)

	<b>Insulator Sample</b>		
	<b>1</b>	<b>2</b>	<b>3</b>
Flashover, kV	195	191	194
Withstand, kV	168	183	183

### Catalog No. 402069-0209 (Vertical)

	<b>Insulator Sample</b>		
	<b>4</b>	<b>5</b>	<b>6</b>
Flashover, kV	171	175	174
Withstand, kV	159	165	165

### III. Critical Impulse Flashover and Withstand

Tests were performed in accordance with ANSI C29.1, sections 4.7 and 4.8. Three insulators designed for horizontal mounting and three for vertical mounting were tested. The results, corrected to standard atmospheric conditions according to ANSI C29, are summarized as follows:

#### Catalog No. 402069-0100 (Horizontal)

	<b>Insulator Sample</b>		
	<b>1</b>	<b>2</b>	<b>3</b>
Positive Flashover, kV	362	354	361
Positive Withstand, kV	348	334	334
Negative Flashover, kV	406	408	408
Negative Withstand, kV	384	384	384

#### Catalog No. 402069-0209 (Vertical)

	<b>Insulator Sample</b>		
	<b>4</b>	<b>5</b>	<b>6</b>
Positive Flashover, kV	377	373	378
Positive Withstand, kV	359	344	349
Negative Flashover, kV	415	411	410
Negative Withstand, kV	400	396	400

## IV. RIV (Radio Influence Voltage)

Tests were performed in accordance with ANSI C29.1, section 4.9. Three insulators designed for horizontal mounting and three for vertical mounting were tested. The results are shown in figures 1 and 2

**Figure 1**

**Figure 2**

## V. Cantilever to Fracture

The insulator is subjected to a cantilever load which is applied rapidly but smoothly from zero to 1,800 lbs. After reaching 1,800 lbs., the rate of load increase is reduced to approximately 20 lbs. per second to failure.

### Catalog No. 402069-0910 (Horizontal)

#### Insulator Sample

	1	2	3
Ultimate Load, lbs.	2,677	2,890	2,720

### Catalog No. 402069-0900 (Horizontal)

#### Insulator Sample

	1	2	3
Ultimate Load, lbs.	2,601	2,542	2,677

## VI. Dye Penetration Rod/Weathershed Subassembly

Rod/weathershed subassemblies without end fittings were cycled between hot and cold water containing fuchsin dye. The test consisted of 10 cycles between a tank containing water and dye at 36°F and a tank containing water and dye at 205°F. The subassemblies were left in each tank for two hours per cycle.

At the completion of the tenth cycle, the insulators were removed from the dye tank and allowed to dry naturally. When completely dry, the specimens were carefully inspected for dye penetration into the rod/weathershed interface. The inspection consisted of carefully cutting the weathershed away from the rod.

**Results:** Three samples were tested and there was no evidence of dye penetration.

## VII. Dye Penetration Insulator Assembly

Complete insulator assemblies were cycled between hot and cold water containing fuchsin dye. The test consisted of 10 cycles between a tank containing water and dye at 36°F and a tank containing water and dye at 205°F. The insulators were left in each tank for two hours per cycle.

At the completion of the tenth cycle, the insulators were removed from the dye tank and allowed to dry naturally. When completely dry, the specimens were carefully inspected for dye penetration into the rod/weathershed, end fitting/weathershed and end fitting/rod interfaces.

**Results:** Three 402069-0910 insulators were tested. There was no dye penetration into interface.

## **VIII. Rod/Weathershed Interface Electrical Puncture**

Interface puncture specimens were cut from molded rod/weathershed subassemblies. The specimens included one weathershed and a precise interface length. The samples were fitted with metal electrodes and submerged in insulating oil. Power frequency voltage was applied between the electrodes and raised at a rate of 1 kV per second until puncture.

**Results:** Eight samples were made from two rod/weathershed subassemblies for a total of 16 puncture test samples. The mean interface puncture strength was 172 rms volts per mil with a standard deviation of 23 rms volts per mil

## **IX. Conclusions**

The insulator test results described in this test report met or exceeded all electrical and mechanical design and catalog requirements established for Veri\*Lite 69 kV line post insulators.

## Appendix A

# Details of Dry and Wet Flashover and Withstand Tests

### I. Dry Flashover and Withstand

402069-0100 (Horizontal)

Test Date: October 1, 1991

Test Conditions:

Dry bulb temperature ..... 77.5°F

Wet bulb temperature ..... 62.5°F

Barometric pressure ..... 28.93 in Hg

Vapor pressure ..... 0.40 in Hg

Relative humidity ..... 42.0%

Dry arc distance ..... 21.0 inches

Leakage distance ..... 51.0 inches

#### Flashover Voltage (kV)

	Insulator #1	Insulator #2	insulator #3
Test 1	210	220	205
Test 2	215	215	208
Test 3	225	225	215
Test 4	225	223	212
Test 5	223	225	205
Average flashover (kV)	220	222	209
Corrected flashover (kV)	242	244	230
Withstand - 60 sec. (kV)	205	205	195
Corrected withstand (kV)	226	226	215

Corrected to standard atmospheric conditions:

Dry bulb temperature ..... 77°F

Barometric pressure ..... 29.92 in Hg

Vapor pressure ..... 0.6085 in Hg

## II. Dry Flashover and Withstand

402069-0209 (Vertical)

Test Date: October 1, 1991

### Test Conditions:

Dry bulb temperature ..... 72.5°F  
 Wet bulb temperature ..... 61.0°F  
 Barometric pressure ..... 28.98 in Hg  
 Vapor pressure ..... 0.41 in Hg  
 Relative humidity ..... 51.5%

Dry arc distance ..... 21.0 inches  
 Leakage distance ..... 51.0 inches

	<b>Flashover Voltage (kV)</b>
